📍 Tan Thoi Hiep Ward, Ho Chi Minh City

Education

- University of Science (HCMUS) – VNU Ho Chi Minh
- Major: Computer Science and Embedded Systems
- **TOEIC:** 830

Work experience

4/2025 - 9/2025 **BeeSmart Solutions**

- Engineered REST APIs using Django to facilitate seamless data access for frontend applications, reducing data retrieval latency for end-users.
- Optimized complex data models and queries using Django ORM, which improved database performance and system responsiveness during peak traffic.
- Integrated Advanced AI Capabilities by deploying Large Language Models (LLMs) and building RAG pipelines, leveraging vector databases and speech-to-text integration to enhance application intelligence.
- Deployed and managed scalable systems using Docker and AWS (EC2), ensuring high availability and consistent environment configuration across development and production.

Skills

Technical Skills:

- Frameworks & Libraries: Django, React
- Tools & DevOps: Docker, AWS (EC2, CodePipeline), Git, WebSockets, REST APIs.
- AI & Data: LLMs, NLP, LSTM, NumPy, Matplotlib, SQL.
- Test case: PyTest, Unittest
- AI Productivity: GitHub Copilot, Cursor, Codex

Projects

PC Shop

Github: https://github.com/0767878237/PC_shop

Technologies: Spring Boot, TypeScript, React, PostgreSQL

- Robust Auth & Security Pipeline: Architected Spring Boot 3 & Java 21 backend auth system featuring Refresh Token Rotation, HttpOnly cookies, and Global Revocation without per-request DB hits.
- Brute-Force & Enumeration Defense: Enforced strict security baseline with BCrypt hashing, standardized API responses to prevent user enumeration, and dynamic account locking after repeated failed logins.
- Smart Cart Reconciliation Engine: Designed a post-login Cart Merge Engine that handles quantity capping against real-time stock levels, prunes stale items, and returns structured warnings to the frontend.
- Fine-Grained Access Control: Implemented state-aware authorization allowing unverified users to browse and manage local carts while blocking critical transactions and checkout operations.

Food Chatbot

Github: <https://github.com/0767878237/chatbot>

Technologies: Python, Streamlit, LangChain, Ollama (Gemma 3:1B), Tavily API, TF-IDF, Cosine Similarity.

- Designed an Agentic/Adaptive RAG pipeline using LangChain Runnables to dynamically route queries between local multi-format datasets (TXT, CSV, JSON) and web search via Tavily API.
- Implemented Query Analysis & Multi-query Retrieval paired with a custom lexical-latent hybrid scoring reranker to improve context relevance.
- Integrated Conversation Memory with query-rewriting logic to support multi-turn, context-aware dialogues.
- Developed an automated evaluation script to benchmark system performance across Top-k accuracy, Top-1 accuracy, and MRR.
